КЛЮЧЕВЫЕ СЛОВА: Phalacridae, *Olibrus*, Южная Африка.

ABSTRACT: Description of *Olibrus festivus* sp.n. and new data on the fauna of the genera *Olibrus* Erichson 1845 from Republic of South Africa are given.

РЕЗЮМЕ. Приводится описание *Olibrus festivus* sp.n. и новые данные по местонахождениям *Olibrus* Erichson 1845 из Южно-Африканской Республики.

This work is based on material from South Africa, kept in the South African National Collection of Insects (Biosystematic Division, ARC-Plant Protection Research Institute, Pretoria) (SANC). The bulk of material treated herein has been deposited in SANC, a few duplicates in the Zoological Museum of the Moscow University (ZMUM). The phalacrid fauna of Southern Africa was studied in Champion [1925], and reviewed in Lyubarsky [1997]. Then *Olibrus rufopunctatus* Lyubarsky, 1997 is transferred to the genus *Podocesus*, *Olibrus sternosetosus* Lyubarsky, 1997 is transferred to *Stilbus* [Svec, 2003].

In this article one species of Phalacridae from RSA are described, basing on the material of SANC and ZMUM. New material from this museum provides additional data on the distribution of *Olibrus bohemani* Champion, 1925; *O. namibiensis* Lyubarsky, 1997; *O. nigroclavatus* Champion, 1925; *O. pondoensis* Champion, 1925; *O. rufoplagiatus* Champion, 1925; *O. quadrifasciatus* Champion, 1925 in Ethiopian Realm. All materials were collected by beating from *Delairea odorata*, *Arctotheca calendula*, *Cineraria lobata*, *Senecio ilicifolius*, *Senecio helminthoides* and *Senecio angustatus* (Asteraceae).

I am very grateful of Elisabeth Grobbelaar for receiving the material.

Grobbelaar (1 spec. SANC, 1 spec. ZMUM); W Cape, Nature's Valley, 18.5 km NE Plettenberg bay, 33.59°S 23.33°E, c. 200 m, 20.08.1998 (with *Delairea odorata*) leg. Neser, Grobbelaar, Balciunas (1 spec. SANC).

**DESCRIPTION.** Length of body 1.9–2.1 mm, short-oval, 1.6–1.7 times as long as broad. Body shining, convex, upper surface dark-brown or black, with yellow apical spot or yellowish apical area. Under surface dark-brown, antennae, mouth parts, and legs yellowish.

Head transverse, widest at eyes. Without microsculpture but very finely and irregularly punctured. Punctures small, spaced by 2–3 or more times their own diameter. Antennae slender, segments 9<sup>th</sup> and 10<sup>th</sup> asymmetric, 10<sup>th</sup> transversal, terminal joint of the club slightly elongate, less than of 9<sup>th</sup> and 10<sup>th</sup> united.

Pronotum transverse, about 0.41–0.48 times longer than wide, posterior edge with large median lobe, finely bordered at base. Pronotal surface shining, slightly shagreened, sparsely covered with very small punctures, approximately 3–4 diameters apart from their lateral neighbours. Prosternal process narrow, bordered laterally.

Scutellum triangular, no broad, about 0.56 times longer than wide, blunt at apex. Scutellar surface shining, shagreened, sparsely covered with small punctures.

Elytra broadest near base, 2.3–2.4 times longer than pronotum, 1.04–1.12 times longer than to their total width. Elytral surface shining, feebly shagreened, strong shagreened in apex, very feeble striate, covered by rounded punctures, indistinctly seriate, approximately 5–7 diameters of puncture apart from their lateral neighbours, intervals extremely finely, sparsely and disorderly punctured. Elytra with one sutural stria, sometimes with weak second stria. First sutural stria not connected with second stria apically. Metasternal process bordered laterally and apically, with punctuation minute, median part sparsely finely pubescent (Fig. 16).

Male genitalia as in Fig. 14, female — as in Fig. 15.

**DISTRIBUTION.** RSA.
