KEY WORDS: Coleoptera, Cantharidae, Silinae, new species, eastern Palaearctic and northern Oriental regions.

КЛЮЧЕВЫЕ СЛОВА: Coleoptera, Cantharidae, Silinae, новые виды, восточно-палеарктическая и северо-ориентальная области.

ABSTRACT. Six new species of the genus *Podosilis* Wittmer, 1978, *P. cinderella*, *P. holzschuhi*, *P. kunmingensis*, *P. putaoensis*, *P. zaitsevi* and *P. zhongdiana* sp. n., are described from China, Vietnam, Laos and Burma. Pronotum and aedeagus of the new species are illustrated. Data on variation and illustrations of *Podosilis murzini* Wittmer, 1997 from Vietnam are also provided.

Introduction

The genus *Podosilis* Wittmer, 1978 was created for soldier-beetles of the subfamily Silinae with complex pronotal armature at sides, almost filiform antennae and cleft male outer claw, and initially included six species, of which one was new and five transferred from the genus *Silis* Charpentier, 1825 [Wittmer, 1978]. In 1992 three new species were described and another two were transferred from *Silis* [Wittmer, 1992]. Shortly afterwards a further contribution to the knowledge of the genus was made, in which 26 new species were added and yet another 16 species were transferred from *Silis*; at that time the number of *Podosilis* species totaled at 53 [Wittmer, 1997].

The species included in the genus are distributed in south-eastern Palaearctic and Oriental regions: in Japan, China, Indochina (Vietnam, Laos, Thailand, Burma), the Philippines, Afghanistan, India, Sri Lanka, Nepal and the Sundaland. The study of recently collected material from China and Indochina led to discovery of six new species of *Podosilis*. Description of these new taxa is presented in the paper below.

The following acronym is used in this paper: ICM — Insect Center, Moscow.

Material and Methods

For examination the beetles were relaxed in water, then their detached abdomina were kept for several hours in 10% KOH at room temperature. The KOH treated aedeagi and terminal abdominal segments were then placed in microvials with glycerin for photographing. MSP-1 zoom stereoscopic dissecting microscope with x8–x80 magnification range was used. Photographs were taken with Canon EOS 6D camera and Canon MP-E 65 mm lens.

Taxonomy

Silinae Mulsant, 1862
Silini Mulsant, 1862

Type genus: *Silis* Charpentier, 1825.

*Podosilis* Wittmer, 1978

Type species: *Silis fruhstorferi* Pic, 1906, author's original designation.

*Podosilis cinderella* Kazantsev, sp. n.

Figs 1–11.

MATERIAL. Holotype, ♀, China, Yunnan, Xiguan (S Dali), 1370 m, 29.VII.2002, S. Murzin leg. (ICM); paratypes, 2 ♀♀ and

New species of *Podosilis* from China and Indochina

♀, same label; ♂, Yunnan, Cangshan Mts, E slopes, 25.43°N 100.06°E, 2500–3000 m, V.Kubáň leg. (ICM).

**Description.** **Male.** Dark brown to black; labial palpomeres 1–3, pronotum and prosternum testaceous (Fig. 1). Vertex flat, finely punctate, shining, with short hairs. Eyes small, interocular distance ca. 3 times greater than eye diameter. Clypeus transverse, rounded anteriorly. Palps slender, ultimate palpomeres elongate, ca. 2 times longer than wide; maxillary ultimate palpomere somewhat wider that preceding palpomeres; labial ultimate palpomere considerably wider than preceding palpomeres. Antennae filiform, attaining to elytral five sixths; antennomere 3 ca. 2.4 times longer than antennomere 2 and ca. 1.3 times longer than antennomere 4; antennomeres with short semi-erect pubescence (Fig. 1).

Pronotum transverse, ca. 1.7 times wider than long, basally almost straight, with noticeable tooth before posterior angle; anteriorly slightly convex, but feebly incised medially; medially with broad obscure impression; anterior angles rounded; sides with relatively small hairy ‘cap’, not surpassing one third of side’s length, and almost square oblique opening at posterior angle; posterior angle moderately produced, with small spine. Scutellum triangular, rounded at apex (Fig. 1).

Elytra ca. 2.4 times longer than wide at humeri, slightly widened posteriorly, with coarse dense punctuation and traces of two longitudinal veins in sutural halves. Pubescence short and sub-erect, not concealing the punctuation. Femoris and tibiae narrow, straight; ratio of hind leg tarsomeres — 1.3:1:0.7:0.6:1.

Spiculum gastrale very narrow, needle-shaped, parallel-sided. Aedeagus with gradually narrowing distally and conspicuously incised medially ventral plate; dorsal plate broad, trapezoidal, concave at sides before distal angles, with con-

---

**Figs 1–11.** Pronotum and aedeagus of *Podosilis cinderella*, sp.n.: 1–2 — pronotum; 3–5 — aedeagus with abdominal segment 9; 6–8 — aedeagus without abdominal segment 9; 9 — tegmen; 10–11 — laterophyses with median lobe; 1, 3–11 — male holotype; 2 — female paratype; 1–2, 5, 8–9, 11 — dorsally; 3, 6 — ventrally; 4, 7, 10 — laterally. Scale bars: 0.5 mm.

Рис. 1–11. Переднеспинка и эдеагус *Podosilis cinderella*, sp.n.: 1–2 — переднеспинка; 3–5 — эдеагус с брюшным сегментом 9; 6–8 — эдеагус без брюшного сегмента 9; 9 — тегмен; 10–11 — латерофизы с медиальной трубкой; 1, 3–11 — самец, голотип; 2 — самка, паратип; 1–2, 5, 8–9, 11 — сверху; 3, 6 — снизу; 4, 7, 10 — сбоку. Масштабные линейки: 0.5 мм.
Female. Similar to male, but pronotum without complex armature, eyes smaller and antennae somewhat shorter (Fig. 2).

Length: 5.0–5.5 mm. Width (humerally): 1.7–1.9 mm.

DIAGNOSIS. *Podosilis cinderella* sp.n. resembles *P. circumcincta* Wittmer, 1997, also from Yunnan, differing by the uniformly black elytra, as well as by the dentate medially dorsal plate (Fig. 9) and less curved and acute distally laterophyses of the aedeagus (Figs 4, 7, 10).

ETYMOLOGY. The new species is named after the heroine of a fairy tale, alluding to its uniformly black elytra.

**Podosilis holzschuhi** Kazantsev, sp.n.

Figs 12–19.

Description. Male. Dark brown to black; pronotum, except medially, in lateral hairy 'caps', and at anterior and posterior margins, and prosternum testaceous (Fig. 12).

Vertex flat, finely punctate, shining, with short hairs. Eyes small, interocular distance ca. 2.6 times greater than eye diameter. Clypeus transverse, trapezoidal, feebly concave anteriorly. Palps slender, ultimate palpomeres elongate, ca. 2

New species of *Podosilis* from China and Indochina

161

times longer than wide, considerably wider than preceding palpomeres. Antennae filiform, attaining to elytral five sixths; antennomere 3 ca. 2.6 times longer than antennomere 2 and ca. 1.3 times longer than antennomere 4; antennomeres with short semi-erect pubescence (Fig. 12).

Pronotum transverse, ca. 1.8 times wider than long, basally slightly convex, without tooth before posterior angle; anteriorly convex; medially with inconspicuous longitudinal impression; anterior angles broadly rounded; sides with hairy ‘cap’, constituting ca. half of side’s length, and triangular oblique opening at posterior angle; posterior angle strongly produced into curved spine. Scutellum triangular, broadly rounded at apex (Fig. 12).

Elytra ca. 2.5 times longer than wide at humeri, almost parallel-sided, with coarse dense punctuation and weak traces of two longitudinal veins in sutural halves. Pubescence short and sub-erect, not concealing the punctuation. Femoris and tibiae narrow, straight; ratio of hind leg tarsomeres — 1:1:0.7:0.6:1.

Spiculum gastrale very narrow, needle-shaped, parallel-sided. Aedeagus with semi-triangular, rounded and inconspicuously incised medially ventral plate; dorsal plate sub-quadrate, emarginate at sides in the middle, with almost straight and bearing small dent medially distal margin, inner surface bearing prominent teeth; laterophyses distinctly diverging and deeply separated, curved, rounded at apex, denticulate, with a smaller dent apically and a stronger dent at two thirds of their length (Figs 13–17).

**Female.** Unknown.

Length: 5.5–5.9 mm. Width (humerally): 1.6–1.7 mm.

**DIAGNOSIS.** *Podosilis holzschuhi* sp.n. is apparently close to *P. donckieri* (Pic, 1906) from Yunnan, with the pronotal armature virtually indistinguishable, however, easily separable by the distinctly more narrow ventral plate of the aedeagus with less incised apex, as well as by the more robust apices of the laterophyses (Figs 13–17).

**ETYMOLOGY.** The new species is named after the collector of the holotype, Dr. Carolus Holzschuh (Villach, Austria).

**VARIATION.** In the paratype the ventral plate of the aedeagus is not incised at apex and the distal margin of the dorsal plate is not dentate in the middle (Fig. 18).

**Figs 27–34.** Pronotum and aedeagus of *Podosilis* species, holotype males: 27–30 — *P. kunmingensis*, sp.n.; 31–34 — *P. putaoensis*, sp.n.; 27, 31 — pronotum; 28–30, 32–34 — aedeagus; 27, 30–31, 34 — dorsally; 28, 32, 24 — ventrally; 29, 33 — laterally. Scale bars: 0.5 mm.

VARIATION. Whereas the structure of the aedeagus in *Podosilis murzini* Wittmer, 1997 appears to be subject to little variation, the pronotum may vary from uniformly orange testaceous, as in the specimen from Thanh Hoa, collected by Dr. Boris Korotjaev (Fig. 20) to almost uniformly black, as in the specimen from Gialai-Kontum collected by Dr. Yuri Zaitsev. The coloration of legs may also vary from uniformly testaceous in the former to uniformly black in the latter specimen.

*Podosilis kunmingensis* Kazantsev, sp.n.
Figs 27–30.

MATERIAL. Holotype, ♀, China, Yunnan, Kunming, Heilongtan, Botanical garden, 1900 m, 1–12.VIII.1996, Dickoree leg. (ICM).

Description. Male. Dark brown to black; pronotum, except in lateral hairy ‘caps’, and at anterior and posterior margins, and prosternum testaceous (Fig. 27).

Vertex flat, finely punctate, shining, with short hairs. Eyes small, interocular distance ca. 2.8 times greater than eye diameter. Clypeus transverse, almost truncate anteriorly. Palps slender, ultimate palpmeres elongate, ca. 2 times longer than wide; noticeably wider than preceding palpmeres. Antennae filiform, attaining to elytral five sixths; antennomere 3 ca. 2.8 times longer than antennomere 2 and ca. 1.2 times longer than antennomere 4; anterommeres with short semi-erect pubesence.

Pronotum transverse, ca. 2 times wider than long, basally almost straight, without noticeable tooth before posterior angle; anteriorly slightly convex; mediadly incised medially; disk medially with broad shallow impression; anterior angles rounded; sides with hairy ‘cap’, constituting ca. half of side’s length, and relatively broad opening at posterior angle; posterior angle little produced. Scutellum triangular, rounded at apex (Fig. 31).

Elytra ca. 2.5 times longer than wide at humeri, slightly widened posteriorly, with coarse dense punctuation and traces of two longitudinal veins in sutural halves. Pubescence short and sub-erect, not concealing the punctuation. Femoris and thiae straight, femoris relatively robust, thiae narrow; ratio of hind leg tarsomeres — 1:0.9:0.8:0.7:1.

Spiculum gastrale very narrow, needle-shaped, parallel-sided. Aedeagus with sub-triangular ventral plate, dentate at sides in the middle and concave and denticulate at distal margin; dorsal plate triangular, semicircular in lateral view; laterophrases distinctly diverging, slightly bent in distal half, narrowed at apex, not denticulate; median lobe with prominent robust spines (Figs 32–34).

Female. Unknown.

Length: 6.3 mm. Width (humerally): 1.9 mm.

DIAGNOSIS. *Podosilis putaoensis* sp.n. is quite unlike any other *Podosilis* species due to its pronotal structure (Fig. 31), and also unique in having the triangular shape of the dorsal plate and semicircular in lateral aspect dorsal plate of the aedeagus (Figs 32–34).

ETYMOLOGY. The new species is named after the type locality.

*Podosilis zaitsevi* Kazantsev, sp.n.
Figs 35–38.

Description. Male. Dark brown to black; frons, clypeus, pronotum, except in lateral hairy ‘caps’, and at posterior margin, and prosternum testaceous (Fig. 27).

Vertex finely punctate, shining, with a pair of small round impressions, with short hairs. Eyes small, interocular distance ca. 2.9 times greater than eye diameter. Clypeus transverse, trapezoidal, truncate anteriorly. Palps slender, ultimate palpmeres elongate, considerably longer and wider than preceding palpmeres. Antennae filiform, attaining to elytral five sixths; antennomere 3 ca. 2.1 times longer than antennomere 2 and ca. 1.2 times longer than antennomere 4; antennomeres with short semi-erect pubesence.

Pronotum transverse, ca. 1.9 times wider than long, basally almost straight, with small tooth before posterior angle; anteriorly slightly convex and feebly incised medially; disk medially with broad shallow impression; anterior angles rounded; sides with hairy ‘cap’, constituting ca. half of side’s length, and relatively broad opening at posterior angle; posterior angle little produced. Scutellum triangular, rounded at apex (Fig. 31).

Elytra ca. 2.5 times longer than wide at humeri, slightly widened posteriorly, with coarse dense punctuation and weak traces of two longitudinal veins in sutural halves. Pubescence short and sub-erect, not concealing the punctuation. Femoris
and tibiae narrow, straight; ratio of hind leg tarsomeres — 1.2:1.0.7:0.8:1.

Spiculum gastrale very narrow, needle-shaped, parallel-sided. Aedeagus with abruptly narrowing distally in distal half and conspicuously incised medially ventral plate; dorsal plate broad, with two broadly separated lobes; laterophyses parallel-sided, almost straight, narrowing distally, not dentate (Figs 36–38).

**Female.** Unknown.

Length: 5.4 mm. Width (humerally): 1.7 mm.

**DIAGNOSIS.** *Podosilis zaitsevi* sp.n. resembles *P. annamita* (Pic, 1928) from south Vietnam, differing by the noticeably shorter overlapping ‘cap’ of the pronotal armature (Fig. 35), as well as by the parallel-sided, approximate and not pointed apically laterophyses of the aedeagus (Figs 36–38).

**ETYMOLOGY.** The new species is named after the collector of the type specimen, Dr. Yurij Zaitsev (Moscow).

**Podosilis zhongdiana** Kazantsev, sp.n.

**Figs 39–43.**

**MATERIAL.** Holotype, ♂, China, NW Yunnan, env. Zhongdian, 3100–3400 m, 4–5.VII.2002, A. Gorodinsky leg. (ICM); paratypes, ♂♂ and ♀♀, same label (ICM).

**Description.** Male. Dark brown to black; pronotum, except at lateral margins of layteral hairy ‘caps’, and prosternum testaceous (Fig. 39).

Vertex flat, finely punctate, shining, with short hairs. Eyes small, interocular distance ca. 2.7 times greater than eye diameter. Clypeus small, transverse, rounded anteriorly. Palps slender, ultimate palpomeres elongate, considerably longer and wider than preceding palpomeres. Antennae filiform, attaining to elytral five sixths; antennomere 3 ca. 3 times longer than antennomere 2 and ca. 1.6 times longer than antennomere 4; antennomeres with short semi-erect pubescence (Fig. 39).

**Figs 35–43.** Pronotum and aedeagus of *Podosilis* species: 35–38 — *P. zaitsevi*, sp.n.; 39–43 — *P. zhongdiana*, sp.n.; 35, 39—40 — pronotum; 36–38, 41–43 — aedeagus; 35–39, 41–43 — male holotypes; 40 — female paratype; 35, 38–40, 43 — dorsally; 36, 41 — ventrally; 37, 42 — laterally. Scale bars: 0.5 mm.

Pronotum transverse, ca. 1.5 times wider than long, basally almost straight, without tooth before posterior angle; anteriorly slightly convex; medially with conspicuous broad impression; anterior angles rounded; sides with small hairy ‘cap’, not surpassing one third of side’s length, and semicircular opening at posterior angle; posterior angle moderately produced, with indistinctly cleft at apex. Scutellum subquadrate, rounded at apex (Fig. 39).

Elytra ca. 2.5 times longer than wide at humeri, slightly widened posteriorly, with coarse dense punctuation, denser distally, and one longitudinal vein near suture. Pubescence short and sub-erect, not concealing the punctuation. Femoris and tibiae narrow, straight; ratio of hind leg tarsomeres — 1.3:1.0:0.8:0.6:1.

Spiculum gastrale very narrow, needle-shaped, parallel-sided. Aedeagus with sub-triangular, conspicuously incised medially ventral plate; dorsal plate broad, semicircular, denticulate; laterophyses approximate and parallel-sided, acute at apex, not denticulate (Figs 41–43).

**Female.** Similar to male, but pronotum without complex armature, eyes smaller and antennae somewhat shorter (Fig. 40). Length: 5.8–6.0mm. Width (humerally): 1.6–1.8 mm.

**DIAGNOSIS.** *Podosilis zhongdiana* sp.n., somewhat resembles *P. yunnana* Wittmer, 1997, distinguishable by the approximate and parallel-sided laterophyses, as well as by the sub-triangular ventral plate and semicircular dorsal plate of the aedeagus (Figs 41–43).

**ETYMOLOGY.** The new species is named after the type locality.

**Acknowledgements.** It is my pleasant duty to express gratitude to Dr. C. Holzschuh (Villach, Austria), Dr. B. Korotjaev (St.-Petersburg), Dr. S. Murzin (Moscow) and Dr. Yu. Zaitsev (Moscow) for the possibility to study the soldier-beetles collected during their trips to China and Indochina.
