**KEY WORDS:** *Walckenaeria*, taxonomy, Urals, Palearctic, distribution.

**КЛЮЧЕВЫЕ СЛОВА:** *Walckenaeria*, таксономия, Урал, Палеарктика, распространение.

**ABSTRACT:** A new subgenus, *Feruralia* subgen.n. (the type-species: *W. kazakhstanica* Eskov in Eskov et Marusik, 1995), of the erigonine genus *Walckenaeria* Blackwall, 1833, and a new species, *W. korobeinikovi* sp.n., from the Urals, are described and illustrated. The new subgenus occupies a position intermediate between the subgenera *Walckenaerias.* str. and *Prosopotheca* Simon, 1884. *W. korobeinikovi* sp.n. belongs to the subgenus *Cornicularia* Menge, 1869, corresponding to the *unicornis*-group, and seems especially close to *W. clavicornis* (Emerton, 1882), but it differs by the long, narrow, distal end of the mesal apophysis of the palpal tibia and shape of the medial plate of the vulva. In the Palearctic, there seem to exist two very closely related species, *W. clavocornis* (Emerton), distributed in Chukot Peninsula, Wrangel Island, and ?East Siberia, and *W. korobeinikovi* Esyunin et Efimik, sp.n., occurring in the Urals, West, Middle and East Siberia, and ?Europe. Diagnostic features of all three Palearctic members of the *unicornis*-group, i.e. *W. clavicornis* (Emerton), *W. karpinskii* (O.Pickard-Cambridge), and *W. korobeinikovi* Esyunin et Efimik, sp.n., are given, and their distribution is discussed.

**РЕЗЮМЕ:** Даны иллюстрированные описания нового подрода, *Feruralia* subgen.n. (типовид *W. kazakhstanica* Eskov in Eskov et Marusik, 1995), в роде пауков-эригонин *Walckenaeria* Blackwall, 1833, и нового вида *W. korobeinikovi* Esyunin et Efimik, sp.n. с Урала. Новый подрод занимает промежуточное положение между подродами *Walckenaeria* s.str. и *Prosopotheca* Simon, 1884. *W. korobeinikovi* sp.n. принадлежит к подроду *Cornicularia* Menge, 1869, соответствующему группе *unicornis*. Этот вид особенно близок к *W. clavicornis* (Emerton, 1882), отличаясь длинным,

узким дистальным концом срединного выроста голени пальпы и формой медиальной пластики вульвы. По-видимому, в Палеарктике есть два близко родственных вида, *W. clavicornis* (Emerton), распространенный на п-ове Чукотка, о. Врангеля и возможно в Восточной Сибири, и *W. korobeinikovi* Esyunin et Efimik, sp.n., встречающаяся на Урале, в Западной, Центральной и Восточной Сибири и возможно в Европе. Приведены диагнозы всех трех палеарктических представителей группы *unicornis*: *W. clavicornis* (Emerton), *W. karpinskii* (O.Pickard-Cambridge) и *W. korobeinikovi* sp.n., обсуждается распространение этих видов.

It is material collected in Bashkiria by Dr. V.E. Efimik in 1989-1990, and in the Polar Urals by Mr. A. Malozemov in 1990, that prompted the present paper. Examination of this material has resulted in the description of a new species of the erigonine genus *Walckenaeria* Blackwall, 1833. According to the description below, *W. korobeinikovi* sp.n. belongs to the subgenus *Cornicularia* Menge, 1869 [s. Wunderlich, 1972], the latter corresponding to the *unicornis*-group of Millidge [1983]. The new species seems extremely close to *W. clavicornis* (Emerton, 1882), this being the reason for numerous errors by our predecessors. Therefore we shall also cope with the problem of the distribution of all three Palearctic members of the *unicornis*-group: *W. clavicornis* (Emerton), *W. karpinskii* (O.Pickard-Cambridge), and *W. korobeinikovi* sp.n. Besides, *W. kazakhstanica* Eskov in Eskov et Marusik, 1995, redescribed here, appears to warrant a new subgenus solely for its accommodation: *Feruralia* subgen.n.

We wish to thank both Mr. A. Malozemov (Perm) for providing us with part of the material treated, and Dr. K.Y. Eskov (Moscow) for the help in sharing information, and encouragement. Our special grati-

tude concerns Dr. K.G. Mikhailov, of the Zoological Museum of the Moscow State University (ZMMU), for the opportunity to (re)study materials under his care. We are also obliged to Dr. S.I. Golovatch (Moscow), who kindly checked the English of the final draft. The work is supported through the INTAS grant 94-3708.

Type specimens have been deposited in the collections of the ZMMU and Department of Zoology of the Perm State University (PSU), as indicated below.

All measurements in the descriptions are given in mm. The collecting localities have been mapped, with the respective numbers put in square brackets ([ ]) referred to in the material section.

#### *Walckenaeria* Blackwall, 1833.

#### *Feruralia* Efimik subgen.n.

Type-species: *Walckenaeria kazakhstanica* Eskov in Eskov et Marusik, 1995.

Diagnosis. Cephalic part of carapace produced forward and somewhat upward, making a well-expressed "neck", ending apically into a protuberance with a brush of closely-packed spines (Figs 1a,b, 2d). All eyes situated on top of cephalic part. A characteristic "file" on dorsal side of carapace (Fig. 1b).

Palpal tibia with a digitiform process at base. Distal end of tibia with a fang (Fig. 2c). A few strong spines between both digitiform process and fang.

Triangular plate of epigyne with a narrow base. Vulva with large, rounded receptacles set well apart (Figs 1c-e).

REMARKS. This subgenus is related to *Walckenaeria* s. str. by the shape of the carapace and rounded receptacles. At the same time, the new subgenus is closed to the subgenus *Prosopotheca* Simon, 1884, by the shape of the process of the palpal tibia and the group of spines on the apical protuberance [s. Wunderlich, 1972]. *Feruralia* subgen.n. is distinguishable from other subgenera by the set of features characterising different subgenera, whereas the "file" on the dorsal side of the carapace seems to be unique.

*Walckenaeria (Feruralia) kazakhstanica* Eskov in Eskov et Marusik, 1995

Figs 1a-e, 2a-d, Map 1.

*Walckenaeria kazakhstanica* Eskov in Eskov & Marusik, 1995: 62, figs 25-26.

*Walckenaeria kazakhstanica*: Eskov, 1994: 114.

MATERIAL. Russia, South Urals, Bashkiria: 1 ♂ (PSU), Shulgan-Tash Reserve nr. Staro-Subkhangulovo [2], Caragana steppe, litter, 10.IX.1989; 1 ♀ (PSU), nr. Syrtlanovo [1], stony steppe, litter, 22.VIII.1990; all leg. V. Efimik.

DESCRIPTION. Male. Total length 2.25. Carapace: 1.08 long, 0.58 wide, dark brown, with obscure markings. Chelicerae: 0.28 long. Legs: dirty yellow; leg I 2.09 long (Fe 0.63, Pt+Ti 0.68, Me 0.45, Ta 0.33), leg IV 2.21 long (Fe 0.60, Pt+Ti 0.75, Me 0.53, Ta 0.33). Tibiae I-IV without dorsal spines. Metatarsi I-IV each with a trichobothrium. Tm I = 0.50. Palp as in Fig. 2a-c. Abdomen: 1.05 long, 0.73 wide, grey.

Female. Total length 2.50. Carapace: 0.90 long, 0.68 wide. Chelicerae: 0.30 long. Legs: leg I 2.05 (Fe 0.60, Pt+Ti 0.70, Me 0.45, Ta 0.30), leg IV 2.07 long (Fe 0.55, Pt+Ti 0.64, Me 0.53, Ta 0.33). Chaetotaxy, colour etc. as in male except Tm I being 0.20. Epigyne and vulva as in Fig. 1c-e.

REMARKS. Previously referred to as a nomen nudum [Eskov, 1992b, 1994], this species is described from the female sex only [Eskov & Marusik, 1995]. Thus, the above is the first description of the male. This species seems to be especially closely related to *W. crocata* (Simon, 1898) by the shape of the palpal tibia. However, it is distinguishable by the shape of both the cephalic part of the carapace and the epigyne.

DISTRIBUTION. Russia: South Urals, Tuva; Kazakhstan: East-Kazakhstan Area [Eskov, 1992b, 1994, Eskov & Marusik, 1995] (Maps 1, 2).

#### Subgenus *Cornicularia* Menge, 1869.

K.Y. Eskov; 1 ♂ (ZMMU: C. clavicornis), Middle Siberia,

Nizhnyaya Tunguska River [15], 40 km off mouth of the Kochchum River, litter, 30.VII.1978, leg. A. Vakhrushev; 1 ♀ (PSU), East Siberia, Magadan Area, Magadan State Reserve [21], Larix flood-forest, 21.VII.1987, leg. O.Y. Mosina.

**DESCRIPTION.** Male. Total length 2.23 (holotype), ranging from 2.15 to 2.38, mean 2.31. Carapace: length

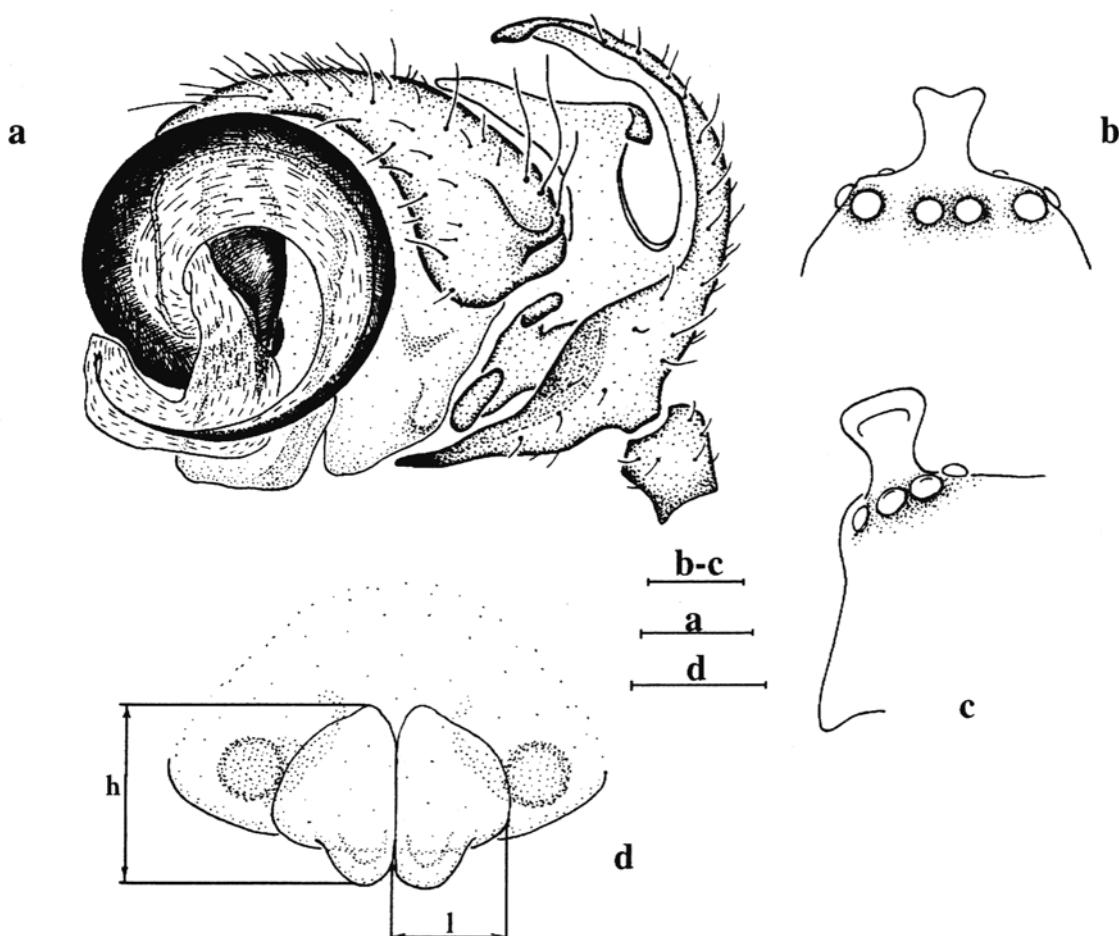

Fig. 3. *Walckenaeria (Cornicularia) korobeinikovi* Esyunin et Efimik, sp.n., ♂ and ♀: a) palp; b-c) ocular area of male carapace; d) epigyne. h — height of epigyne plate; l — width of epigynal plate. Scale = 0.10.

Рис. 3. *Walckenaeria (Cornicularia) korobeinikovi* Esyunin et Efimik, sp.n., ♂ и ♀: а) пальп; б-с) глазная область карапакса самца; д) эпигина. h — высота пластинки эпигины; l — ширина пластинки эпигины. Шкала 0,10.

0.93 (holotype), ranging from 0.85–0.95, mean 0.92, width 0.68, 0.63–0.75, and 0.68, resp.; orange-brown, with obscure markings. A stout horn in ocular area (Fig. 3b-c). Sternum: orange-brown, with dark margins. Chelicerae: 0.35 long. Legs: red-yellow; leg I 2.28 long (Fe 0.70, Pt+Ti 0.78, Me 0.45, Ta 0.35), leg IV 2.62 long (Fe 0.75, Pt+Ti 0.91, Me 0.58, Ta 0.38). Leg sizes of paratypes see Table 1.

Tibiae I-II with two dorsal spines, and tibiae III-IV with one each. Metatarsi I, IV each with a trichobothrium. Tm I — 0.5. Palp as in Figs 3a, 4d-f. Abdomen: 1.30 (1.39:1.30–1.43) long, 0.78(0.85:0.80–0.93) wide, grey to black.

Female. Total length 2.50. Carapace: length 0.96, ranging from 0.85 to 1.05, width 0.69, ranging from 0.65 to 0.75. Abdomen: length 1.54, ranging from 1.33 to 1.70, width 0.88, ranging from 0.75 to 1.00. Size of legs given above. Chaetotaxy, colour as in male. Epigyne and vulva as in Figs 3d, 5c-d, h.

**VARIABILITY.** Size variation of carapace and epigynal plate as in Figs 6, 7. Epigynal plate shapes vary as in Fig. 5c,h.

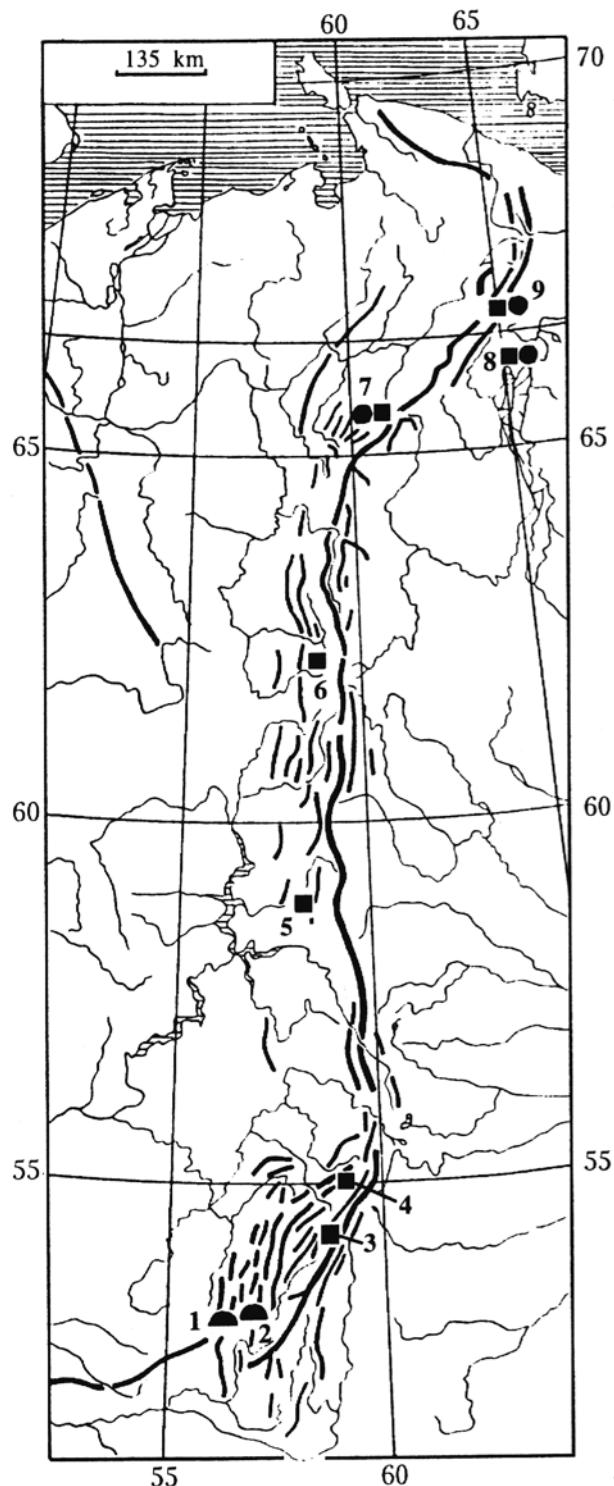

**DIAGNOSIS.** This species belongs to the *unicornis*-group [s. Millidge, 1983], being closer to *W. clavicornis*

(Emerton, 1882). Both species are similar in the size of the carapace (Fig. 6), but there is a distinction in the shape of the epigynal plate (Fig. 7). The new species differs from *W. clavicornis* in the form of the palpal tibia (cp. Figs 4d-f & 4a-c), with the distal end of the mesal apophysis being much longer. The females of these species are distinguished by the shape of the medial plate of the vulva (cp. Figs 5c-d & 5a-b).

**NAME.** The species is dedicated to the late Dr. Yu.I. Korobeinikov, a famous Ural entomologist.

**REMARKS.** The records of *W. clavicornis* from the Polar Urals [Tanasevitch, 1985], northeastern Taimyr Peninsula, Vaigach Island, Krasnoyarsk Province, Putorana Plateau, and the environs of Norilsk [Eskov, 1985] are referred in fact to the new species (see above under Material). Although not proved by pertinent material, the majority of *W. clavicornis* records from other localities in West, Middle and perhaps even East Siberia also seem to actually belong to *W. korobeinikovi* sp.n. (also see remarks under *W. clavicornis*).

Holm [1967] compared specimens from Helvellyn, West Moreland (about 1000 m a.s.l.), Sweden, with a *W. clavicornis* sample from Greenland and concluded that "this specimen has parallel tibial apophyses but the

Средняя Сибирь: 13 — окрестности Норильска, 14 — плато Путорана, 15 — река Нижняя Тунгуска. 16 — Чукотка, верховья реки Большая Осиновская. 17 — Западная Чукотка, между Эгвекинот и Иультин. 18 — остров Врангеля. 19 — Восточно-Казахстанская область, горы Саур. 20 — Тува, Торгалиг. 21 — Магаданская область, Магаданский заповедник.

distal part of the inner apophysis is bent slightly inwards, a trait which it has in common with Swedish specimens of the species. Quite probably there is a tendency for separate geographical forms to appear in this species" (p. 26). We agree with Holm that European specimens are distinct from *W. clavicornis*, being a new species. Although we have not seen any material from the West Palearctic, we are inclined to believe that the new species described just above occurs in Europe as well. Hence, *W. korobeinikovi* sp.n. seems to be a boreo-montane Euro-Siberian species.

**HABITAT.** Habitat data indicate that *W. korobeinikovi* sp.n. dwells in dwarf *Betula* stands within the Urals, and it has been found in various moist biotopes, e.g. paludal forests, boggy depressions and bogs, in Siberia. Both males and females have been encountered throughout the summer, from June till August.

**DISTRIBUTION.** Polar Urals and regions immediately adjacent to the Urals: Yugorski Peninsula, South Yamal. West Siberia: Yuganski Reserve; Middle Siberia: nr. Norilsk, Putorana Plateau and Nizhnyaya Tunguska River; East Siberia: Magadan Reserve (Maps 1, 2).

*Walckenaeria (Cornicularia) clavicornis* (Emerton, 1882).

Figs 4a-c, 5a-b, g. Map 2.

MATERIAL. 5 ♀♀ (ZMMU), Chukotka, Upper Bolshaya Osinovaya River (tributary of Belaya River [16]), grove, litter, 13.VII.1989; 1 ♀ (ZMMU), East Chukotka, btw. Egvekinot & Iultin [17], canyon, 22.VI.1989, all leg. & det. Y.M. Marusik; 1 ♂, 1 ♀ (PSU), Wrangel Island [18], Rogers Bay, pitfall trap, 5-19.VI.1990; 4 ♂♂, 13 ♀♀ (ZMMU: det. K.Y. Eskov & Y.M. Marusik), same locality, Somnitelnaya Bay, 1984-1986, all leg O. Khruleva.

**DESCRIPTION.** Genitalia of both male and female as in Figs 4a-c, 5a-b, g; non-genital characters see in Millidge [1983].

**REMARKS.** So far it has been believed that *W. clavicornis* is a widely distributed, trans-Holarctic species [Holm, 1967; Wunderlich, 1972; Millidge 1983]. Eskov [1988] pointed out that it is widespread in Siberia. Based on a study of pertinent material, we can confirm that *W. clavicornis* does occur in Chukotka (original data) and Wrangel Island [Eskov, 1985; Khruleva,

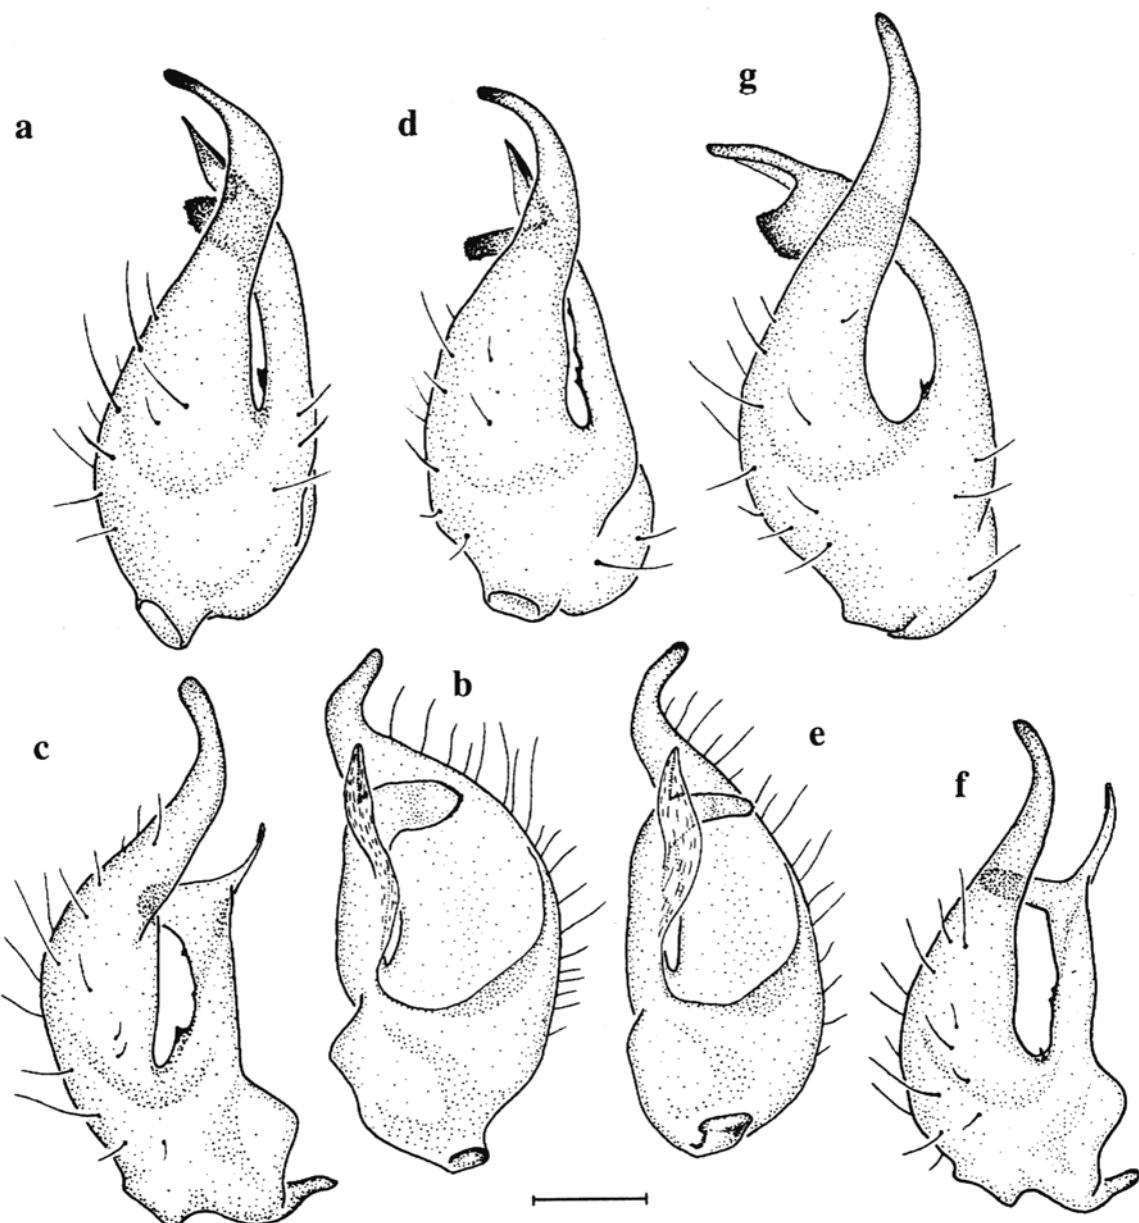

Fig. 4. *Walckenaeria (Cornicularia)* spp., ♂ palpal tibia: a-c) *W. clavicornis* (Emerton, 1882); d-f) *W. korobeinikovi* Eyunin et Efimik, sp.n.; g) *W. karpinskii* (O.Pickard-Cambridge, 1873). Scale = 0.10.

Рис. 4. *Walckenaeria (Cornicularia)* spp., ♂, голень пальпы: а-с) *W. clavicornis* (Emerton, 1882); д-ф) *W. korobeinikovi* Eyunin et Efimik, sp.n.; г) *W. karpinskii* (O.Pickard-Cambridge, 1873). Шкала 0,10.

1987]. In addition, specimens deriving from Dzhugdzher Mt. Range (Khabarovsk Prov.) [Eskov, 1988, 1992a], the coast of the East-Siberian Sea [Eskov, 1985], Upper Kolyma River [Eskov, 1988] and Central Yakutia [Koponen & Marusik, 1992] are also likely to refer to this species. Other records of *W. clavicornis* from Siberia and Mongolia deserve verification, same as those from the West Palearctic [Holm, 1967; Wunderlich, 1972; Byzova et al., 1986].

**DISTRIBUTION.** Russia: Chukotka, Wrangel Island and ?East Siberia. North America [Millidge, 1983], Greenland and ?Spitzbergen [Holm, 1967].

#### *Walckenaeria (Cornicularia) karpinskii* (O.Pickard-Cambridge, 1873)

South Urals, Chelyabinsk Area, Sibirka Village [3], mossy fir-grove, litter, 8.VII.1984; 1 ♂ (PSU), same locality, mixed *Betula-Pinus* forest, litter, 7.VII.1975, all leg. N.M. Pakhorukov; 1 ♀ (ZMMU; det. K.G. Mikhailov), Murmansk Area, Khibiny Mts., nr. Kirovsk, moss-lichen tundra, 13-23.IX.1986, leg. T.E. Rossolimo; 1 ♂, 4 ♀♀ (PSU), West Siberia, Tyumen Area, Yuganski Reserve,

mixed forest, litter, 1987, leg. M. Belyaeva & V. Novokshonov; 2 ♀♀ (ZMMU; det. Y.M. Marusik), Chukotka, Iultin, 25.VI.1989, leg. Y.M. Marusik; 2 ♀♀ (ZMMU; det. Y.M. Marusik), East Chukotka, Upper Bolshaya Osinovaya River (tributary of Belaya River), alder forest, 11-15.VII.1989, leg. Y.M. Marusik.

**DESCRIPTION.** Genitalia of both male and female as

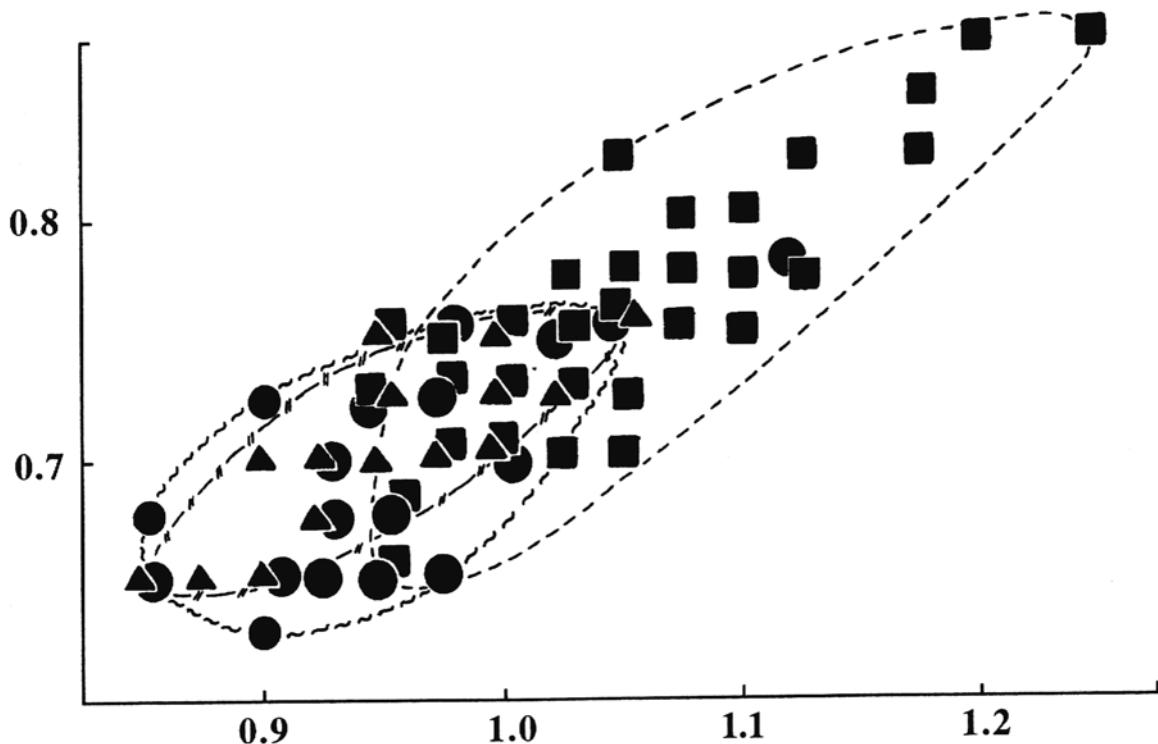

Fig. 6. Width/length ratio of carapace in *Walckenaeria clavicornis* (Emerton, 1882) (triangle), *W. korobeinikovi* Eyunin et Efimik, sp.n. (circle), *W. karpinskii* (O.Pickard-Cambridge, 1873) (square).

Рис. 6. Соотношение ширины и длины головогруди у *Walckenaeria clavicornis* (Emerton, 1882) (треугольник), *W. korobeinikovi* Eyunin et Efimik, sp.n. (круг), *W. karpinskii* (O.Pickard-Cambridge, 1873) (прямоугольник).

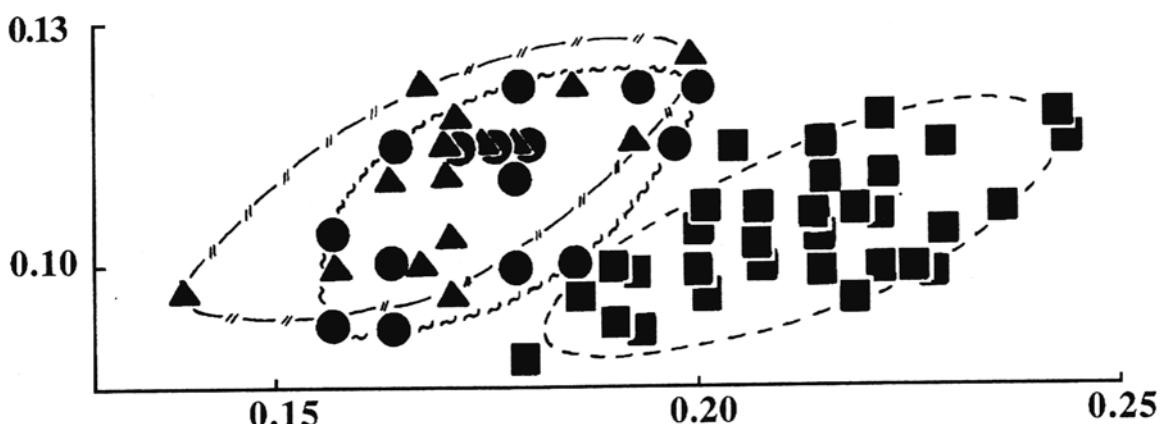

Fig. 7. Width (l) to height (h) ratio of epigynal plate (Fig. 3d) in *Walckenaeria clavicornis* (Emerton, 1882) (triangle), *W. korobeinikovi* Eyunin et Efimik, sp.n. (circle), *W. karpinskii* (O.Pickard-Cambridge, 1873) (square).

Рис. 7. Соотношение ширины (l) и высоты (h) (рис. 3д) пластинок эпигини *Walckenaeria clavicornis* (Emerton, 1882) (треугольник), *W. korobeinikovi* Eyunin et Efimik, sp.n. (круг), *W. karpinskii* (O.Pickard-Cambridge, 1873) (прямоугольник).

in Figs 4g, 5e-f; non-genital characters see in Millidge [1983]. Females of *W. karpinskii* are distinct from both *W. clavicornis* and *W. korobeinikovi* in the proportions of the epigynal plate (Fig. 7) as well as in size: individuals of *W. holmi* are larger (Fig. 6).

DISTRIBUTION. Urals: mountains of the Polar, North, Middle and South Ural [Map 1: original data; Pakhorukov, 1984; Tanasevitch, 1985; Eyunin, Polanin, 1990; Eyunin, 1991]. Russia: ranging from Murmansk

Area [original data; Byzova et al., 1986], Karelia [Tseliarus & Shorokhov, 1985; Uzenbaev, 1986, 1992; Uzenbaev & Predtechenskaya, 1991] and Moscow Area [Beer, 1968] in the west up to Chukotka [original data], Khabarovsk Prov., Sakhalin Island and Maritime Prov. [Eskov, 1992a] in the east, and from the tundra zone in the north up to the South Urals, Tuva, Chita Area [Eskov, 1992b] and Maritime Prov. in the south. A trans-Holarctic boreo-montane pattern.

Table 2. Distinctive characters of *unicornis*-group species.  
Таблица 2. Отличительные признаки видов группы *unicornis*.

	<i>W. clavicornis</i>	<i>W. korobeinikovi</i>	<i>W. karpinskii</i>
Mean carapace length ♂	0.98(0.95–1.03)	0.92(0.85–0.95)	1.03(0.95–1.10)
	♀ 0.95(0.85–1.05)	0.96(0.85–1.05)	1.06(0.95–1.25)
Mean carapace width ♂	0.72(0.70–0.75)	0.68(0.63–0.75)	0.74(0.65–0.83)
	♀ 0.70(0.65–0.75)	0.69(0.65–0.75)	0.77(0.70–0.88)
Mesal and lateral tibial apophyses	parallel (Figs 4a,c,d,f)		crossing (Fig. 4g)
Distal end of the mesal apophysis	wide and short (Fig. 4b)	long and narrow (Fig. 4e)	—
Epigynal plate ratio (width/height)	0.65(0.56–0.72) (Fig. 7)	0.62(0.54–0.69) (Fig. 7)	0.49(0.44–0.54) (Fig. 7)
Shape of the epigynal plate	plates with a distinct lateral bulge (Fig. 3d and figs 279, 281, 283 in Millidge, 1983)		plates with parallel borders, without distinct lateral bulge (Figs 278, 280, 282 in Millidge, 1983)
Shape of the medial plate of the vulva	not broader than long (Fig. 5 a,g)	broader than long (Fig. 5 c,h)	—

HABITAT. This species is common in zonal and mountain tundras within the Urals. It can also be found in forest ecosystems within the mountain-forest belt of the South Urals. Both males and females have been collected throughout the vegetative period, from June till September.

Distinctive characters of *unicornis*-group species discussed above are summarized in Table 2.
