**KEY WORDS:** *Julus, ghilarovi, brachydactylus, insolitus*, taxonomy, millipedes, fauna, new records, Siberia, Asian Russia.

**КЛЮЧЕВЫЕ СЛОВА:** *Julus, ghilarovi, brachydactylus, insolitus*, таксономия, двупарногие многоножки, фауна, новые находки, Сибирь, азиатская часть России.

**ABSTRACT.** The following few taxonomic changes are proposed: *Julus ghilarovi* Gulička, 1977, stat.revalid. ex *Julus ghilarovi ghilarovi* Gulička, 1972, *Julus ghilarovi brachydactylus* Gulička, 1972 = *Julus brachydactylus* Gulička, 1972, stat.n. = *Julus insolitus* Mikhajlova, 2009, syn.n. The distributions of both species are refined.

**РЕЗИОМЕ.** Предложены несколько таксономических изменений: *Julus ghilarovi* Gulička, 1972, stat.revalid. ex *Julus ghilarovi ghilarovi* Gulička, 1972, *Julus ghilarovi brachydactylus* Gulička, 1972 = *Julus brachydactylus* Gulička, 1972, stat.n. = *Julus insolitus* Mikhajlova, 2009, syn.n. Для обоих видов приведены уточненные сведения по их распространению.

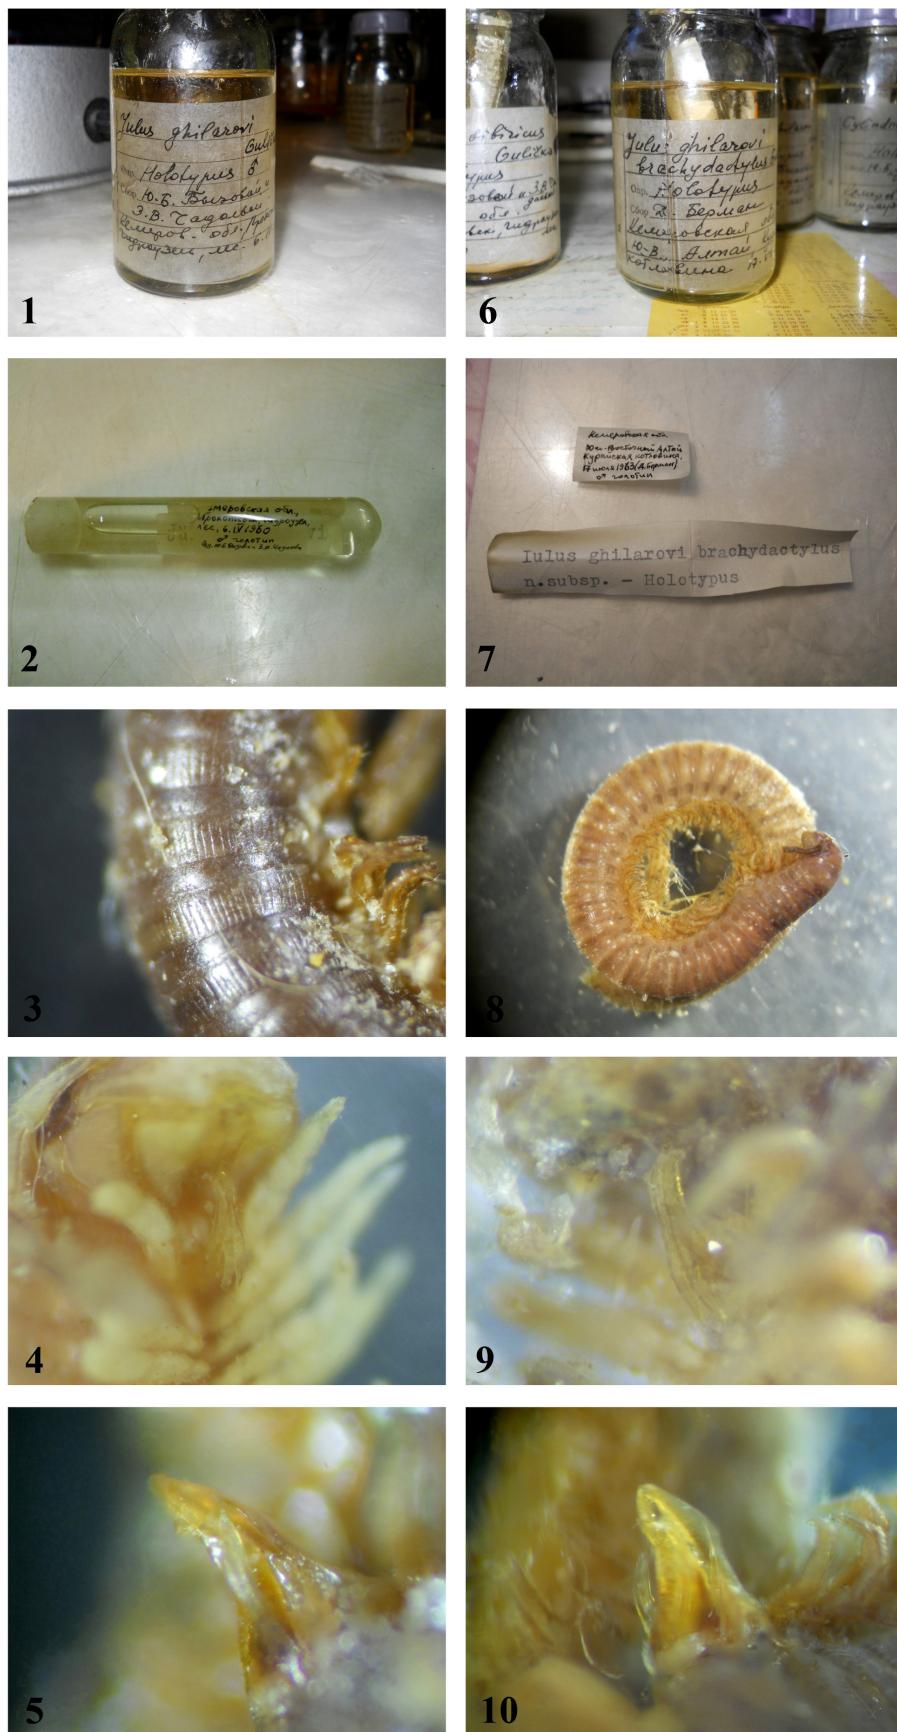

## Introduction

In 1963 and 1972, the Czechoslovak myriapodologist Jan Gulička, of Bratislava, published the results of his studies on some millipede material from the former Soviet Union, mostly Siberia, that had been sent to him by Prof. M.S. Ghilarov, Head of the Laboratory of Soil Zoology at the A.N. Severtsov Institute of Animal Evolutionary Morphology and Ecology, USSR Academy of Sciences, Moscow (now the Institute for Problems of Ecology and Evolution, Russian Academy of Sciences, Moscow). Among the numerous Diplopoda then considered, Gulička [1963] described a new species of *Julus* Linnaeus, 1758 he dedicated to M.S. Ghilarov: *Julus ghilarovi* Gulička, 1963, from the Kemerovo

Area, southwestern Siberia. That was the first valid record of a *Julus* in the Asian part of Russia, because the original description of *Julus profugus* Stuxberg, 1876, from between Tomsk and Kansk [Stuxberg, 1876], was too poor to be certain about its generic allocation.

*Julus* Linnaeus, 1758 is a rather small, but common and widespread genus of the diplopod family Julidae; it counts 18 species or subspecies and covers much, but not all of the Palaearctic, ranging from Western Europe (east of both Ireland and the Iberian Peninsula) in the west, through the Caucasus, to southern Siberia and Mongolia in the east [Evsyukov *et al.*, 2018].

A few years following the description of *J. ghilarovi*, Gulička [1972] distinguished two subspecies of that species: *J. g. ghilarovi* and *J. g. brachydactylus* Gulička, 1972. The latter subspecies he described from the Kurai Depression, SE Altai, was stated to differ from the nominotypical *J. g. ghilarovi* only by the structure of the opisthomere. In particular, this was depicted to lower and wider, with a notch/emargination between the lateral process of the opisthomere and the solenomere being relatively shallow, only ca 1/3 as deep as opisthomere height. Subsequent records of *J. g. brachydactylus* from near Ust-Kan and in eastern Kazakhstan [Mikhajlova, Golovatch, 2001] added some more characters that distinguished these two subspecies even more clearly, but for a long time they all were regarded as demonstrating only intraspecific variations between these two forms [Mikhajlova, 2004]. The *J. g. ghilarovi* – *J. g. brachydactylus* pair of subspecies remained the sole in *Julus*. A few more records of *J. g. brachydactylus* from south of Lake Teletskoye [Nefedieva, Nefediev, 2008] were later re-identified as *J. insolitus* Mikhajlova, 2009 [Nefediev, Nefedieva, 2013; Nefedieva *et al.*, 2014, 2015].

Only very recently has E.V. Mikhaljova [2017] reinstated the minimal variability in *J. g. ghilarovi* both in the shape of the outer lateral process of the opisthomere and the depth of its notch. She also pointed out the need to check the distribution area of this subspecies.

To solve the riddle, the type material of both subspecies of *J. ghilarovi*, now deposited in the collection of the Zoological Institute, St. Petersburg, Russia (ZIN), has been restudied. Additional material of *J. ghilarovi* s.str. from the collections of the Zoological Museum of the Lomonosov Moscow State University, Moscow (ZMUM) and the Federal Scientific Center of the East Asian Terrestrial Biodiversity, Far Eastern Branch of the Russian Academy of Sciences, Vladivostok (FSCB), both Russia, has also been re-examined. Fresh material from a typical territory of *J. g. brachydactylus* has been taken and considered as well. The present paper clarifies the status of both subspecies of *J. ghilarovi*, provides new records and refines the distribution area of the species involved.

The new material treated herein has mainly been deposited in the collection of the Altai State University, Barnaul, Russia (ASU), partly shared also between the ZMUM and FSCB collections.

The specimens were examined using MBS-1, MBS-9 and MBS-10 stereo microscopes, and stacks of colour images were manually generated using a Nikon Coolpix L22 digital camera. SEM micrographs were prepared at two labs: the Laboratory of Phylogeny and Faunogenesis, Institute of Systematics and Ecology of Animals, Siberian Branch of the Russian Academy of Sciences, Novosibirsk, Russia (ISEA) using a Hitachi TM-1000 scanning electron microscope; and the Laboratory of Aquatic Ecology, Institute for Water and Environmental Problems, Siberian Branch, Russian Academy of Sciences, Barnaul, Russia (IWEP) using a Hitachi S-3400N scanning electron microscope. Digital images were prepared with the help of Helicon Focus 6 image stacking software. The distribution map was composed using QGIS 3.0.

## Taxonomic part

### Class Diplopoda

### Order Julida

### Family JULIDAE

Gusalov, M.F. Maurstad, V. Løveng; 4 ♂♂, 5 ♀♀, 1 ♂ subad., 1 ♀ subad. (ASU), same Republic, Kosh-Agach District, 5.5 air-km NNE of Kurai, S macroslope of Kurai Mt. Range, valley of Kuraika River, left bank of Kuraika River, 5.5 km up the river from Chuya Tract, *Larix sibirica* and *Picea obovata* forest with *Pinus sibirica*, *Caragana arborescens*, low grasses and green mosses, 50.28225°N, 87.95463°E, ca 1790 m a.s.l., in mosses, under fallen tree trunks, 25.07.2018; 3 ♂♂, 13 ♀♀, 2 ♀♀ subad., 1 juv. (ASU), same Republic, same District, 20 air-km NE of Kokorya, W macroslope of Chikhachiova Mt. Range, Talduair Massif, valley of Sailyugem River, right bank of Sailyugem River, bottom of S slope, screes with *Astragalus*, *Artemisia*, *Comarum salesovianum*, 50.01770°N, 89.23775°E, ca 2245 m a.s.l., under stones lying on bush branches, in herb debris, 26.07.2018; 1 ♂, 2 ♀♀ (ASU), Russia, Altai Province, Zalesovo District, at border with Kemerovo Area, 54.23553°N, 85.375949°E, *Betula* forest with *Ribes nigrum*, 400 m a.s.l., 3.07.2018, all leg. P.S. Nefediev; 1 ♂, 4 ♀♀ (ASU), Russia, Novosibirsk Area, Toguchin District, Yuryt, 14.08.2007, leg. A.S. Babenko.

TYPE MATERIAL RE-EXAMINED. ♂ holotype of *Julus ghilarovi* Gulička, 1963 (ZIN), labeled "Kemerovo Area, Prokopievsk, waterworks, forest, 6.IV.1960, Yu.B. Byzova, Z.V. Chadaeva".

REMARKS. Despite the holotype of *J. ghilarovi* Gulička, 1963 remaining intact, I do not hesitate to confirm that the specimen belongs to a typical ♂ of *J. ghilarovi*. No dissection of the gonopods was necessary, because they protrude outside and can easily be examined in situ (see also below). In addition, the large coxal outgrowth of ♂ leg pair 2 is slender all along, with a posterior process (Figs 1–5).

MATERIAL RE-EXAMINED (specimens previously identified as *J. ghilarovi* or *J. g. ghilarovi* and published by Mikhaljova, 1993, Mikhaljova, Golovatch, 2001, Mikhaljova, Nefediev, 2003). 6 ♀♀ (FSCB), [Russia, southwestern Siberia, Republic of Altai, Ulagan District], Altai Mts., Kuraisky Mt. Range, Aktash, 2500 m, *Betula nana* [in fact, *Betula rotundifolia*] + mountain tundra, under stones, 12–25.07.2000, leg. O. Gorbunov; 1 ♂, 5 ♀♀ (FSCB), Krasnoyarsk Province, Sayano-Shushenskii Nature Reserve, Lake

Ekspeditsionnoye, bald mountain (= goltsy), 2100 m a.s.l., 27.07.–20.08.1993; 1 ♂ (FSCB), same locality, pitfall traps, 14–19.07.1992; 1 juv. (FSCB), same locality, plot B, soil sample 61, AoF, 18.07.1992; 1 ♂ (FSCB), same locality, plot B, soil sample 63, AoF, 18.07.1992, all leg. L.B. Rybalov; 11 ♂♂, 6 ♀♀, 17 juv. (FSCB), Republic of Khakassia, Bolshoi On River, 15.06.1990, leg. A.B. Ryvkin; 3 ♂♂, 4 ♀♀, 1 ♂ subad., 1 ♀ subad., 8 juv. (ASU), same Republic, [Shira District], near Kommunar, ca 2 km upstream of Bolnichnyi Stream, lower part of talus, under stones and moss, 30.07.1999; 2 ♂♂, 6 ♀♀, 2 juv. (ASU), same locality, *Abies* forest, 2.08.1999; 1 ♂ (ASU), same locality, *Betula* and *Abies* forest, 2.08.1999; 2 ♂♂, 8 ♀♀, 4 ♂♂ subad., 1 ♀ subad., 6 juv., 1 fragm. (ASU), same Republic, [Shira District], near Kommunar, ca 4 km upstream of Bolnichnyi Stream, mixed forest, 1.08.1999, all leg. P.S. Nefediev.

REMARKS. A restudy of ten ♀♀ from the Altai Mts., Kuraisky Mt. Range, near Aktash, 2500 m a.s.l., *Betula nana* + mountain tundra, under stones, 12–25.VII.2000, leg. O.G. Gorbunov, previously identified as *J. ghilarovi* by Mikhaljova, Nefediev [2003], shows that only six ♀♀ actually belong to *J. ghilarovi*. A re-examination of all specimens from the Krasnoyarsk Province, Sayano-Shushenskii Nature Reserve, previously determined as *J. g. ghilarovi* by Mikhaljova, Golovatch [2001], shows that all of them apparently belong to a new species of *Julus* (sp. 1). The same situation was faced as regards all specimens from the Republic of Khakassia, Bolshoi On River, previously identified as *J. g. ghilarovi* by Mikhaljova [1993], as all of these samples belong to another new species (*Julus* cf. sp. 2). Hence, these localities can be excluded from the distribution area of *J. ghilarovi*, whereas these new species will be described elsewhere. However, a restudy of some material from the environs of Kommunar [see Mikhaljova, Nefediev, 2003] shows that *J. ghilarovi* does inhabit the Republic of Khakassia (see re-examined records above), as well as *Julus* cf. sp. 2.

DISTRIBUTION. Being one of the most widespread *Julus* species in SW Siberia, the distribution area of *J. ghilarovi* is restricted to the Novosibirsk and Kemerovo areas, the Republic of Khakassia, the Altai Province and the Republic of Altai (Fig. 18).

#### *Julus brachydactylus* Gulička, 1972, stat.n. Figs 6–11, 13, 16–18.

P.S. Nefediev.

**TYPE MATERIAL RE-EXAMINED.** ♂ holotype of *Julus ghilarovi brachydactylus* (ZIN), labeled "Kemerovo Area [sic!], SE Altai, Kurai Depression, 17 July 1963, D. Berman" [locality refined by the collector: Russia, southwestern Siberia, **Republic of Altai**, Kosh-Agach District, environs of Kurai Village, 2 km upstream of Chuya Tract along left bank of Kuraika River, motley grass gramineous steppe, 17.07.1963, leg. D.I. Berman].

**REMARKS.** A restudy of the ♂ holotypes of *J. ghilarovi* Gulička, 1963 and *J. g. brachydactylus* Gulička, 1972 shows

that both males undoubtedly belong to one species: *Julus ghilarovi* Gulička, 1963. Although both are intact, their gonopods are well exposed, thus requiring no dissection and making their study easy *in situ* (see also above). The large coxal outgrowth of ♂ leg pair 2 is slender all along, with a posterior process; a thin longitudinal crest is present on the posterior face of the gonopodal promere (Figs 6–11).

According to the original descriptions [Gulička, 1963, 1972], all holotypes should have been deposited in the author's collection in Bratislava, while paratypes in the ZIN collection. However, Gulička had not shared the promised paratypes until S.I. Golovatch requested their return to the USSR. Only after a scandal did Gulička finally return the holotypes to Golovatch who then rendered them to ZIN. Yet some vials contained deliberately wrong specimens (females instead of males), torsos without gonopods, incorrect labels, etc. (S.I. Golovatch, pers. comm.). Among Gulička's returned diplopods, no paratypes of *J. ghilarovi* s.str. had come back, but he had labeled "*Julus ghilarovi brachydactylus* n. subspec. – Holotypus" and sent back an erroneous male of *J. ghilarovi* instead of *J. g. brachydactylus*. Besides this, the Kemerovo Area is a separate region which borders from the north only with the Republic of Altai, but the Kurai Depression is situated much more southeast of the Kemerovo Area, indicating a label error as well (Fig. 7).

**MATERIAL RE-EXAMINED** (specimens previously identified as *J. ghilarovi* and published by Mikhaljova, Nefediev [2003]). 8 ♀♀ (FSCB), [Russia, southwestern Siberia, **Republic of Altai**,

Ulagan District], Altai Mts., Kuraisky Mt. Range, Aktash, 2500 m a.s.l., *Betula nana* [in fact, *Betula rotundifolia*] + mountain tundra, under stones, 12–25.07.2000, leg. O.G. Gorbunov.

**REMARKS.** A restudy of ten ♀♀ from the Altai Mts., Kuraisky Mt. Range, near Aktash, 2500 m a.s.l., *Betula nana* + mountain tundra, under stones, 12–25.VII.2000, leg. O.G. Gorbunov, previously identified as *J. ghilarovi* by Mikhaljova & Nefediev [2003], and of four ♀♀ from the same locality, previously determined as *Pacifiulus amurensis* (Gerstfeldt, 1859) by Mikhaljova & Nefediev [2003], shows that four ♀♀ of the former species and all ♀♀ of the latter one actually belong to *J. brachydactylus* stat.n.

**MATERIAL RE-EXAMINED** (material previously identified as *J. g. brachydactylus* and published by Mikhaljova, Golovatch [2001]). 2 ♂♂, 3 ♀♀, 2 juv. (FSCB), [Kazakhstan, Eastern Kazakhstan Area], W-Altai, Ivanovsky Mt. Range, Mt “Rossynoi Belok”, 2000–2300 m a.s.l., mountain tundra, 1–2.06.1996, R.Yu. Dudko coll.; 8 ♂♂, 2 ♀♀, 4 juv. (FSCB), [Russia, Republic of Altai, Ust-Kan District], E slope of Korgon Mt. Range, lower flow of Kutergen River, 2 km S of Ust-Kan, ca 1200 m a.s.l., 12.06.1998; 3 ♂♂, 15 juv. (FSCB), [same Republic, same District], E slope of Korgon Mt. Range, lower flow of Kutergen River, 25 km S of Ust-Kan, ca 2000 m a.s.l., 15.06.1998, all leg. A.A. Matalin.

**REMARKS.** A re-examination of all above specimens from eastern Kazakhstan and the environs of Ust-Kan, previously identified as *J. g. brachydactylus* by Mikhaljova & Golovatch, [2001], shows that they belong to a new species, *Julus* sp. 3. It is noteworthy that all of these specimens are in very poor condition and most of them are completely broken into pieces. Very recently, I have collected more than 100 fresh specimens of this new species and its description will appear a forthcoming publication.

**MATERIAL RE-EXAMINED** (specimens previously identified as *J. g. ghilarovi* and published by Mikhaljova, Golovatch [2001]). 30 ♂♂, 20 ♀♀, 63 juv. (ZMUM), 2 ♂♂ (FSCB), [Russia, southwestern] Siberia, [Republic of Altai, Ulagan District], Altai Mts., Lake Teletskoe, Altaisky Nature Reserve, Chiri, upper reaches of Chiri River, *Picea obovata* + *Pinus sibirica* taiga forest, 1350 m, 28–29.07.1997; 27 ♂♂, 19 ♀♀, 15 juv. (ZMUM), same locality, near Lake Chiri, subalpine belt (= goltsy), 1750–2000 m a.s.l., 29–30.07.1997; 7 ♂♂, 4 ♀♀, 7 juv. (FSCB), same locality, nr Lake Chiri, upper timberline of *Picea obovata* + *Pinus sibirica* taiga, mainly nr water, 1700–1750 m, 29.07.–1.08.1997, all leg. S. Golovatch & A. Tanasevich.

**REMARKS.** A restudy of the above material from south of Lake Teletskoye in the environs of the Chiri cordon, previously determined as *J. g. ghilarovi* by Mikhaljova, Golovatch [2001], shows that all these specimens belong to a new species (*Julus* sp. 2), same as all specimens identified as *J. insolitus* and published in Nefedieva *et al.* [2014, 2015]. Besides this, the records of *J. insolitus* from the Kemerovo Area (Shorskii National Park) and the Republic of Altai (upper reaches of Chiri River), published by Mikhaljova [2016], appear to be morphologically similar to specimens of *J. insolitus* from Nefedieva *et al.* [2014, 2015] as well (E.V. Mikhaljova, pers. comm.), apparently also belonging to *Julus* sp. 2.

**DISTRIBUTION.** The distribution area of *Julus brachydactylus* stat.n. covers only the territory of the Republic of Altai (Fig. 18).

## Discussion

A restudy of the holotypes of *Julus ghilarovi* Gulička, 1963 and *J. g. brachydactylus* Gulička, 1972, both deposited in ZIN, shows that these specimens belong to one species: *J. ghilarovi*. A mix-up must have hap-

pened to the holotype sample of *J. g. brachydactylus* before it joined the ZIN collection (see above). As Gulička's *J. g. brachydactylus* is easy to recognize and the false “*J. g. brachydactylus* Gulička, 1972 Holotype” sample in ZIN actually contains a different species (*J. ghilarovi*), to overcome the mislabeled type option, I am inclined to designate a neotype of *J. g. brachydactylus* coming from a precise locality.

The illustration of the opisthomere of *J. g. brachydactylus* in the original description [Gulička, 1972] is so similar to that of *J. insolitus* Mikhaljova, 2009 (Figs 11, 13) that I do not hesitate to synonymize both these taxa and promote *J. g. brachydactylus* to a full species rank.

Since the gonopods and ♂ leg pair 2 of both the species concerned, *J. ghilarovi* and *J. brachydactylus*, have never been shown in due detail, I provide their SEM micrographs (Figs 14–17).

## Conclusions

Despite the considerable confusion as regards the taxonomy and distribution of the only pair of subspecies heretofore delimited within the genus *Julus*, i.e. the southern Siberian *J. ghilarovi* with the formal subspecies *J. ghilarovi* and *J. g. brachydactylus*, I believe that: (1) *J. ghilarovi* has no subspecific taxa and its full species status is revalidated; (2) the subspecies *J. g. brachydactylus* Gulička, 1972 is elevated to a full species rank, with *J. insolitus* Mikhaljova, 2009 being a junior synonym of *J. brachydactylus* Gulička, 1972, syn.n., stat.n.

The distribution of *J. ghilarovi* is mostly restricted to southwestern Siberia (the Novosibirsk and Kemerovo areas, the Altai Province and the Republic of Altai), as well as to southeastern Siberia (the Republic of Khakassia), whereas the southern part of the Krasnoyarsk Province must be removed from the distribution area of this species. The distribution range of *J. brachydactylus* stat.n. spans only the Republic of Altai, where it can often be found living syntopically with *J. ghilarovi*.

At least three new species of *Julus* have been found when refining the taxonomy and distribution areas of *J. ghilarovi* and *J. brachydactylus* stat.n., their descriptions are to be deferred for the future.

**ACKNOWLEDGEMENTS.** I am most grateful to S.I. Golovatch, Moscow, Russia who significantly improved and kindly checked the English of an advanced draft. I am very thankful to all curators and colleagues of the several academic institutions of Russia for the access to the diplopod collections under their care: S.I. Golovatch (ZIN and ZMUM), V.A. Krivohatsky, S.Yu. Sinev (both ZIN), R.V. Yakovlev (ZMUM and FSCB), Ark.A. Schileyko, E.N. Kudryavtseva (both ZMUM), E.V. Mikhaljova and A.S. Lelej (both FSCB). My deepest gratitude is extended to D.I. Berman (Magadan, Russia) for his important hints concerning the type locality of one of the species involved. I am also deeply obliged to R.V. Yakovlev, Barnaul, Russia, who

kindly invited me to participate in the joint Norwegian-Russian trip to the Mountainous Altai, conducting under the auspices of V.I. Gusarov, Oslo, Norway. Special thanks are also addressed to all participants of this trip: M.F. Maurstad and V. Løveng, two students from Oslo, Norway and A.V. Gulyaev, Biysk, Russia, our experienced driver. I am very much obliged to R.Yu. Dudko (ISEA, Novosibirsk, Russia) and V.V. Kirillov (IWEP, Barnaul, Russia) who kindly provided the facilities for taking SEM micrographs, as well as to A.V. Dyachenko (IWEP, Barnaul, Russia) for the assistance in using the SEM facilities. I very much appreciate the help of N.A. Usik (Barnaul, Russia), Head of the ASU Herbarium, for the identification of plants. I am also thankful to all collectors who donated me their material for study.
